Outline

- Motivation
 - Issues with modeling the diurnal cycle of precipitation
 - Efforts in the field
- A modified convective trigger
 - Philosophy
 - Observational evidence
- Application to EAMv1
 - Mean precipitation
 - Diurnal cycle of precipitation
 - Propagation of meso-scale convective systems
- Summary

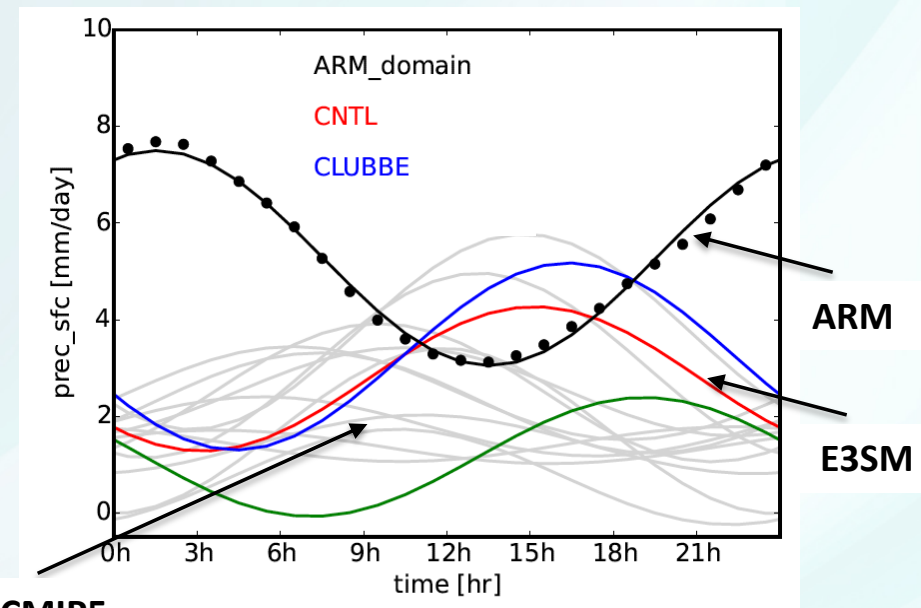

Model Errors in Simulating Diurnal Cycle of Precipitation

Problems larger over land than over ocean

- Rainfall occurs too early after sunrise and "too frequent, too weak"
- Fail to capture the nocturnal peak over the central Great Plains
- No eastward propagation of MCSs from the Rocky Mountain to the central Great Plains.

No clear improvement with increasing model horizontal resolution

Deficiencies in Model Convective Triggers

CAPE-Based Trigger (e.g., ZM, $\text{CAPE} > 70 \text{ J/kg}$), where *CAPE* is calculated from an air parcel originating from the PBL

- Unrealistically strong coupling of convection to surface heating
- Lack of convection inhibition
- Lack of additional large-scale dynamic & thermodynamic controls (e.g., tropospheric moisture, low-level convergence)?
- Roles of cold pools?

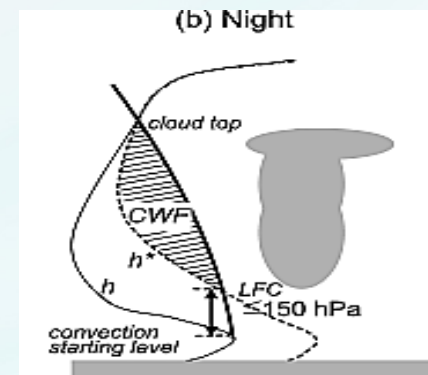

Zhang 2003; Kain 2004; Bechtold et al. 2004, 2008; Lee et al. 2008; Han and Pan 2011; Neale et al. 2013; Wang et al. 2015

Problems with CAPE-based trigger

==> Convection would be triggered too often over land during warm season

Nocturnal Precipitation

*Convection
elevated

Surface
decoupled*

Lee et al. 2008

How to Improve the Convective Trigger?

Two key areas:

- *How to prevent convection from being triggered too frequently?*
- *How to capture elevated nocturnal convection, which occurs from moist conditionally unstable layers located above the boundary layer?*

The DCAPE Trigger (*Xie and Zhang 2000*)

Xie and Zhang (2000) introduced a dynamic CAPE generation rate (**DCAPE**) to control the onset of deep convection, which was tested in CAM2 (Xie et al. 2004) and is being used in JMA's operational NWP model.

Dynamical CAPE:

$$\text{DCAPE} = [\text{CAPE}(T^*, q^*) - \text{CAPE}(T, q)] / \Delta t,$$

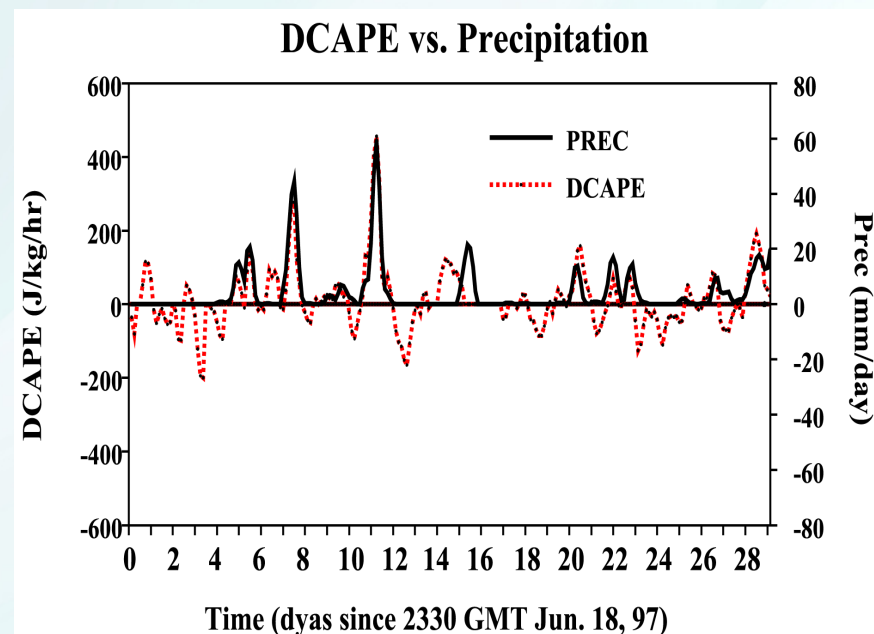

Where

$$T^* = T + (\partial T / \partial t)_{adv} * \Delta t;$$

$$q^* = q + (\partial q / \partial t)_{adv} * \Delta t$$

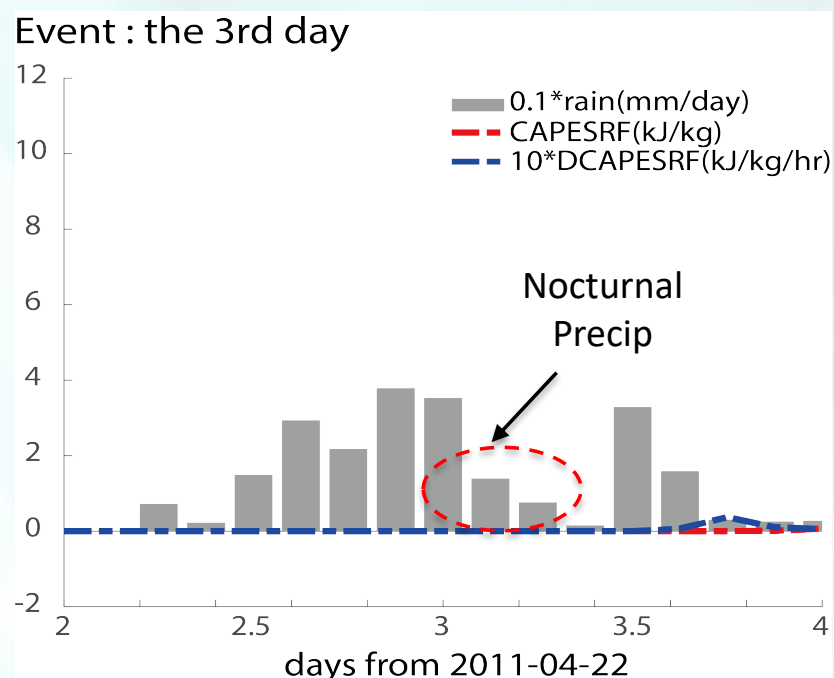

New Trigger: CAPE>0 & DCAPE>0

Convection can only be triggered when the large-scale forcing is making a positive contribution to the existing CAPE. The DCAPE trigger links cumulus convection directly to the large-scale dynamic forcing, such as lower level convergence.

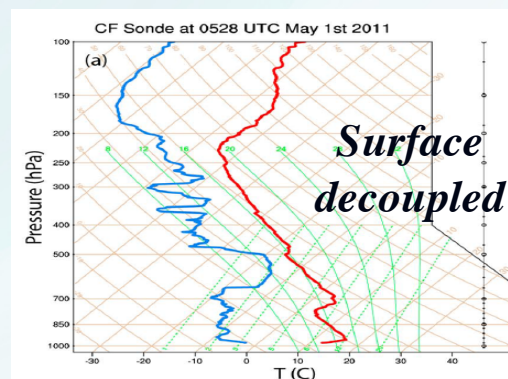

DCAPE may not work for some elevated nocturnal convection cases

(CAPE, DCAPE) vs. Precipitation

An elevated nocturnal case selected from the ARM M3CE field campaign at SGP

Very stable PBL

Xie et al. 2014

No CAPE and DCAPE are detected if the convection starting level is limited in the PBL, as assumed in several deep convection schemes including the ZM scheme

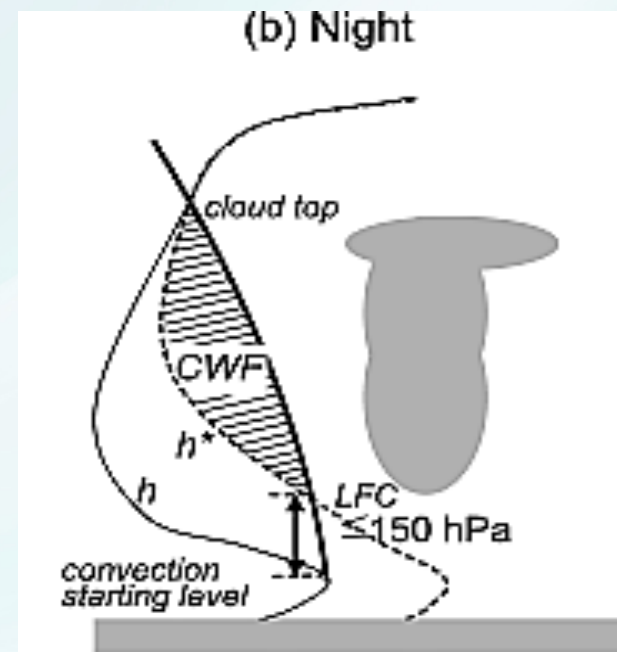

Unrestricted Launch Level (ULL)

(Wang et al. 2015)

Unrestricted Launch Level (ULL):

The ULL method defines an air parcel launch level to be level where the maximum MSE is found below 600 hPa with searching from the surface.

- *Allows air parcel launching above PBL to capture elevated convection*

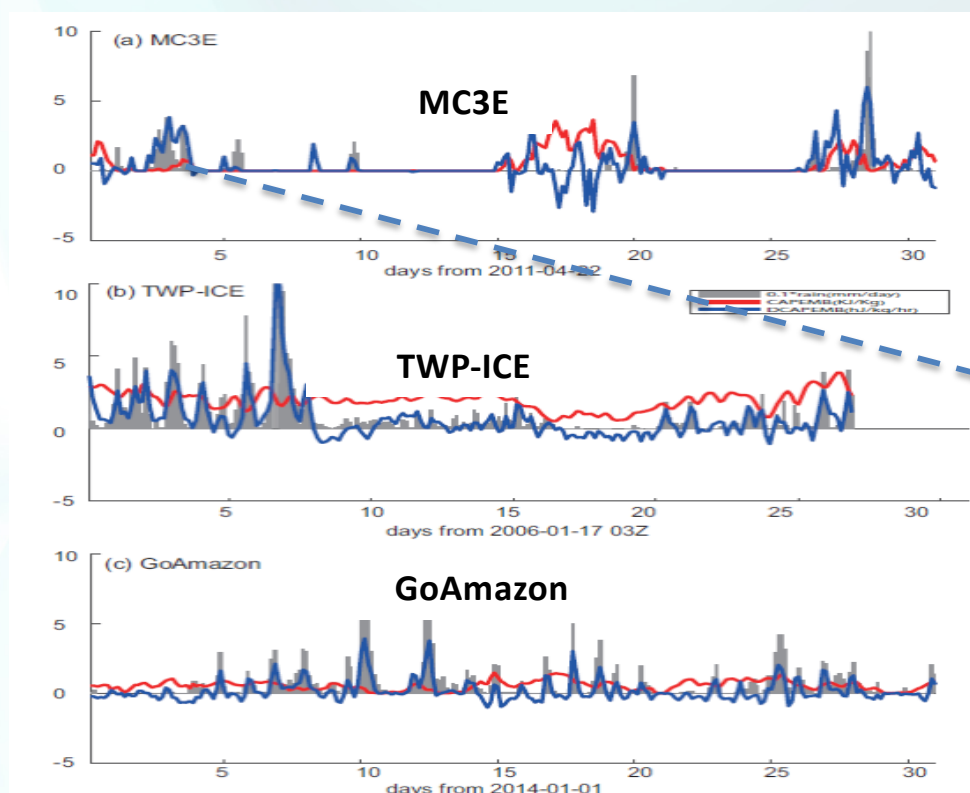

*Convection
elevated*

Lee et al. 2008

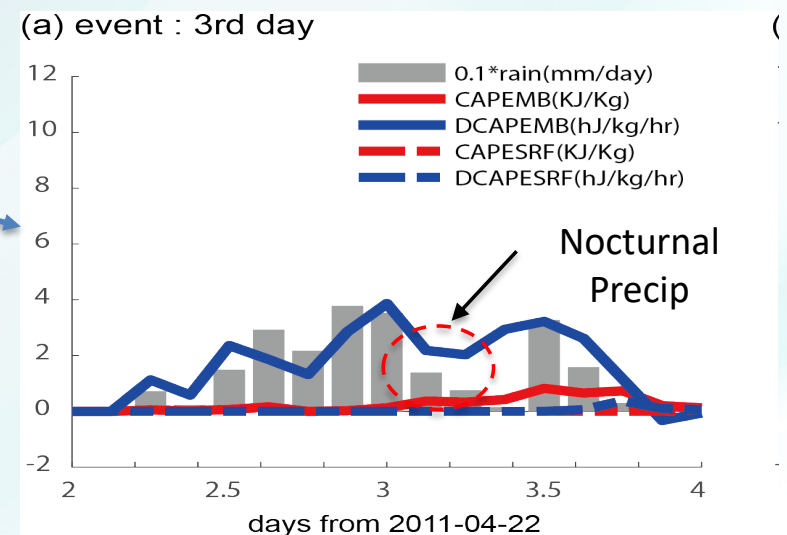

A Modified Convective Trigger

- A modified trigger combined the DCAPE trigger with the ULL concept: **(CAPE > 0 & DCAPE > 0) + ULL**

(CAPE, DCAPE) vs. Precipitation over different climate regimes

Selected Nocturnal Precipitation Case

Application to EAMv1

EAMv1

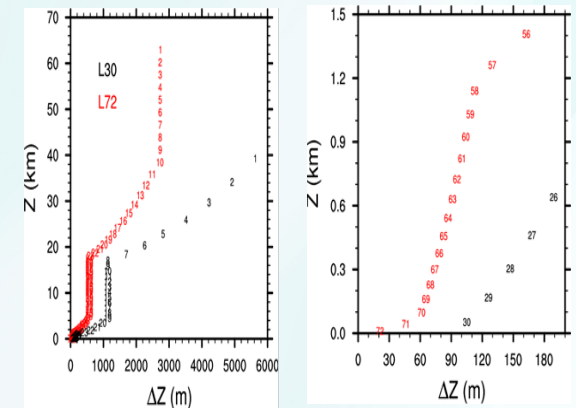

EAMv1 starts from CAM5.3 + Spectral Element (SE) Dycore (**EAMv0**), but with increased horizontal and vertical resolution, as well as notable changes to its physical parameterizations, particularly in aerosols, clouds, and convection. Similar to CAM6

➤ Resolution

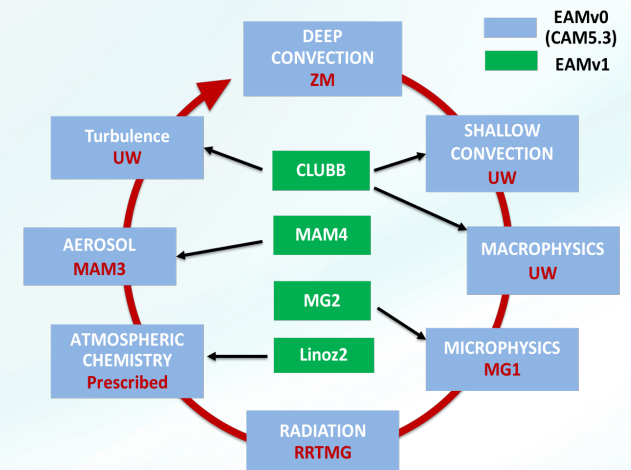

- Standard version: 1° in horizontal and 72 layers with top at $\sim 60\text{km}$, better resolved vertical structures
- High-res version: 0.25° in horizontal and 72 layers, better resolved both horizontal and vertical structures

➤ Physics

- Zhang-McFarlane (1995) (ZM) for deep convection
- CLUBB for a unified treatment of shallow convection/turbulence/macrophysics
- MG2 for microphysics with improved ice microphysics
- MAM4 with Improvements in treating aerosols
- Simple Ozone (linearized production and loss)

Physics: EAMv0 → EAMv1

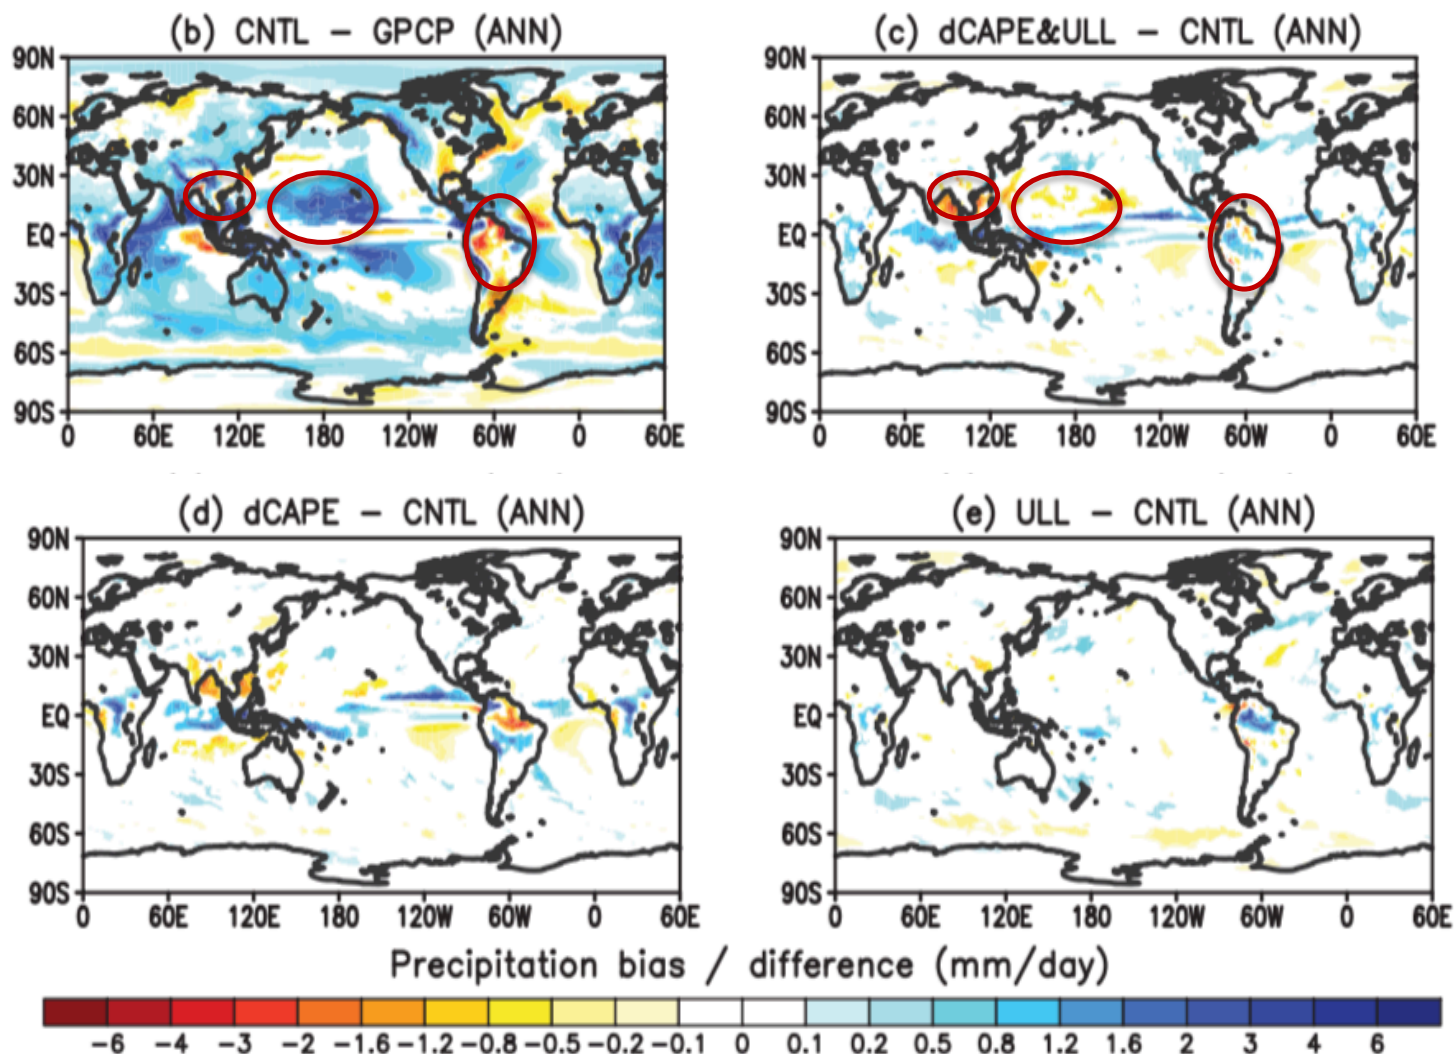

Experiment Design

Model resolution is 1 deg and 72 levels. 11-yr AMIP run; 2-11 year simulations are analyzed

Case	Description	Convective Trigger
Control	Default low-resolution (1 ⁰) EAMv1	CAPE > 70 J/kg
DCAPE+ULL	Control with the proposed new convective trigger	1) DCAPE > 0 & CAPE>0 2) Allow unrestricted parcel launching level (ULL) below 600mb
DCAPE	Control with the DCAPE trigger only	DCAPE > 0 & CAPE>0
ULL	EAMv1 with ULL only	Same as Control, but allow unrestricted parcel launching level (ULL)

Annual Mean Precipitation

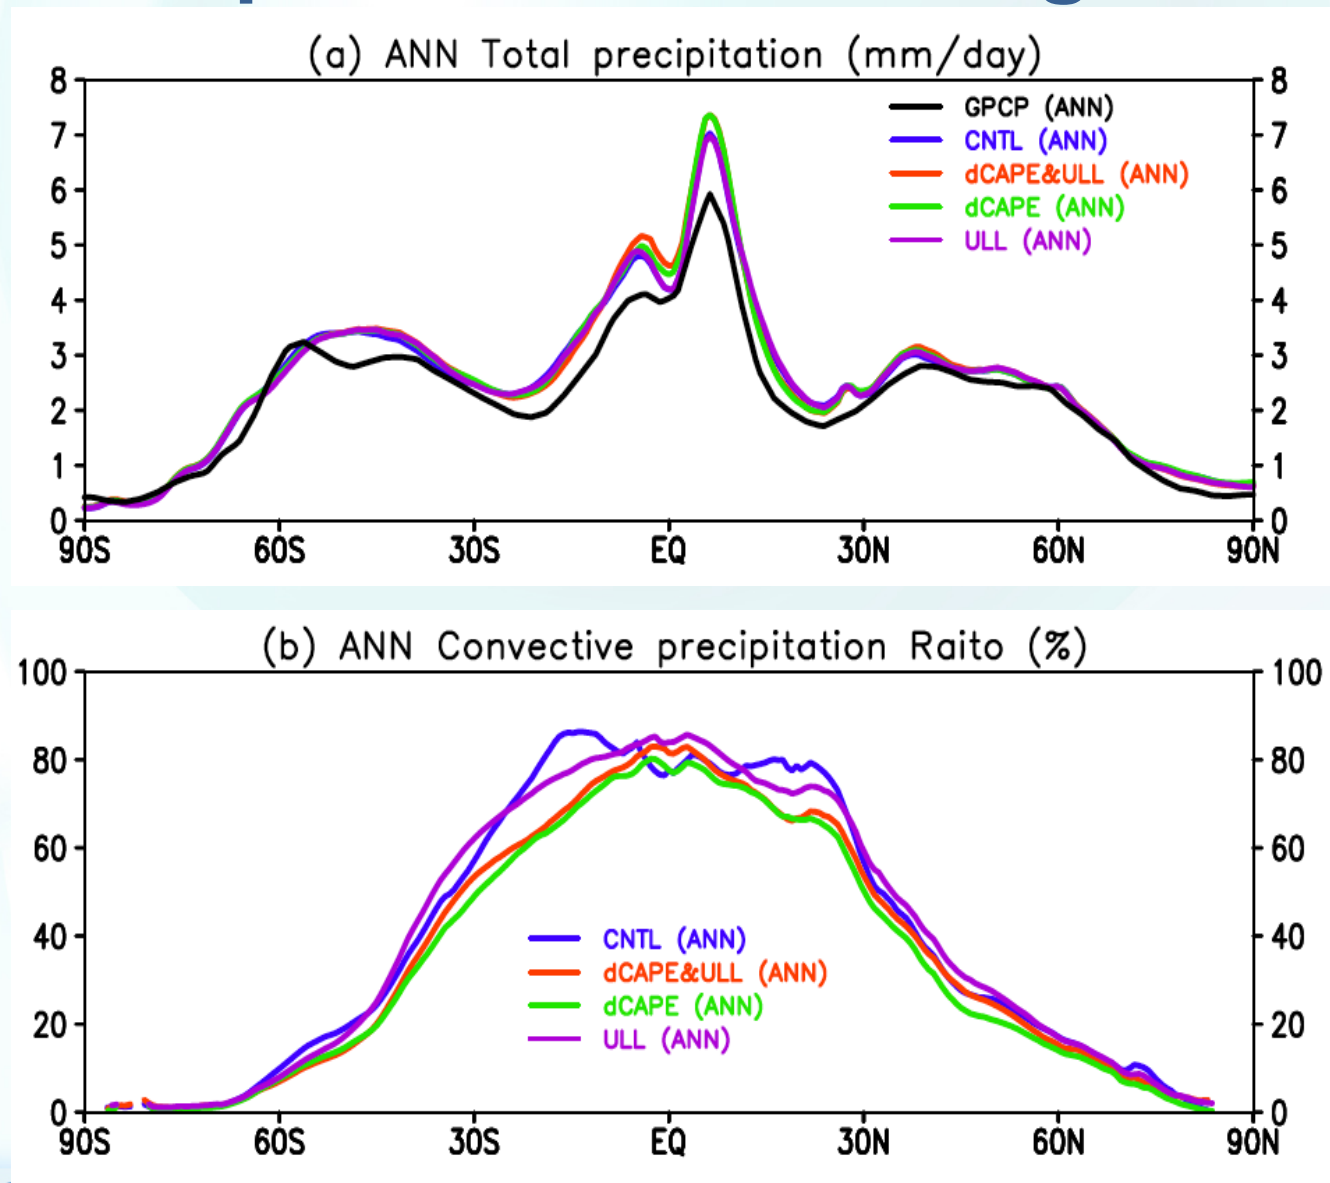

Only show the differences that are statistically significant

Overall impact on the mean state is minor

- Slight improvements over equatorial and subtropical Pacific and Atlantic, the Indian peninsula and surrounding oceans, South America
- A slight degradation is seen in the northern ITCZ in the eastern Pacific
- dCAPE plays a major role in changes seen in mean state

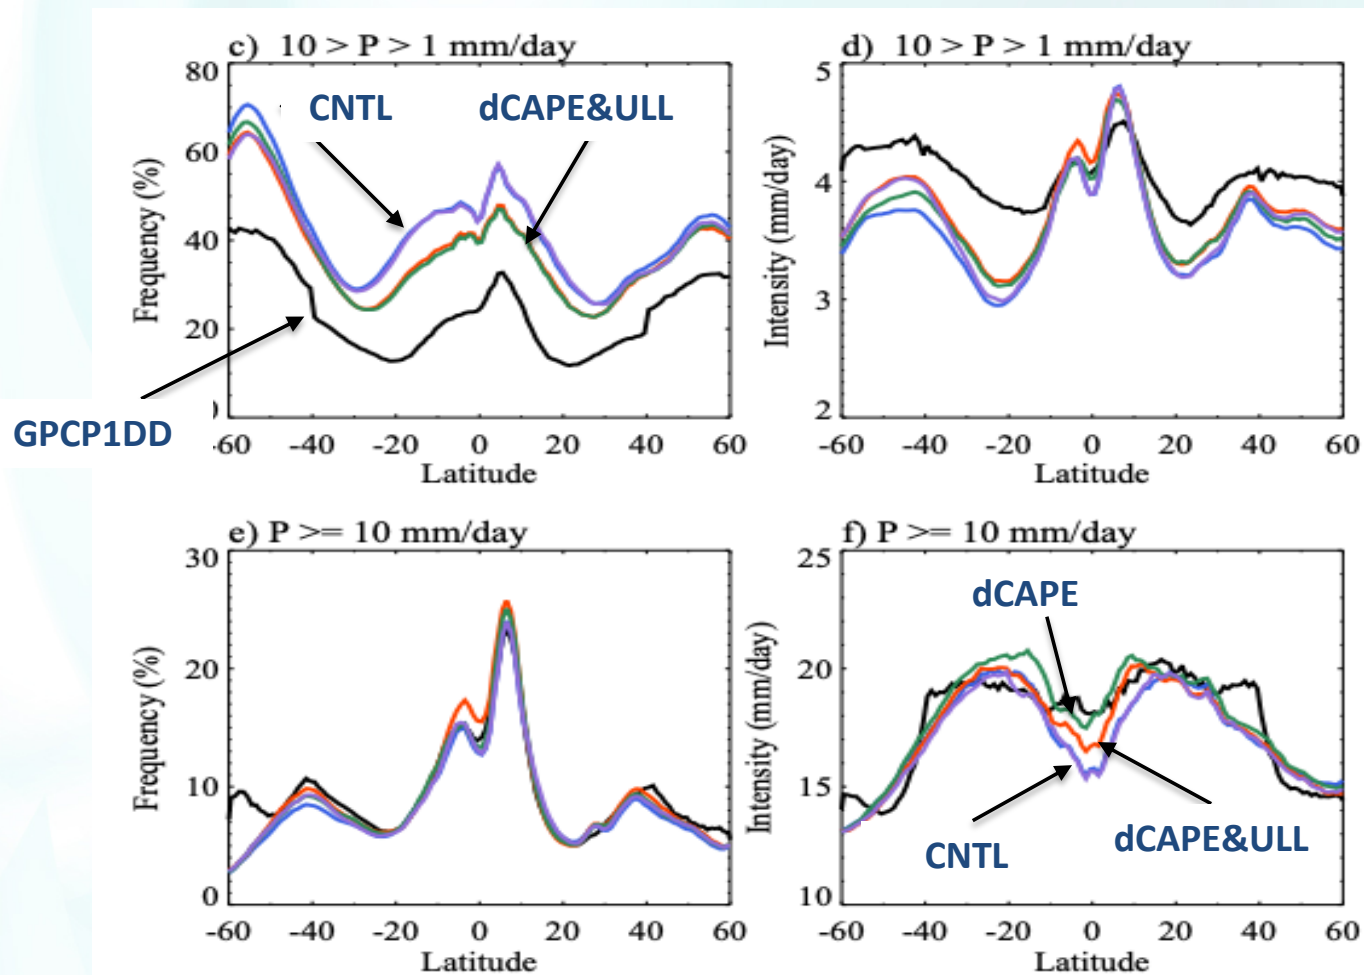

Precipitation Partitioning

Changes in total precip are minor

Considerable reduction of **convective precipitation fraction** over the subtropical regions with the use of the **dCAPE** trigger.

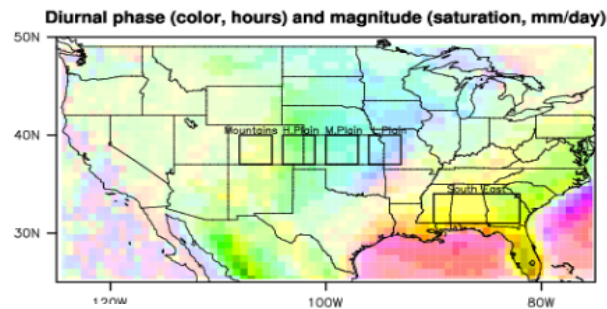

Precipitation frequencies and intensities

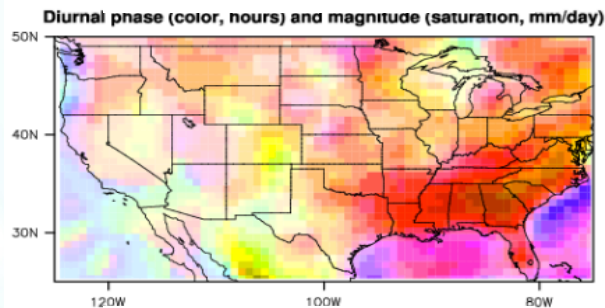

- EAMv1 "too frequent, too weak) for light-to-moderate precip
- EAMv1 does a decent job for the moderate-to-heavy precip in frequency, but largely underestimate the intensity in tropics
- The new trigger reduces the frequency of light-to-moderate precip and increase the intensity of moderate-to-heavy precipitation due to the use of **dCAPE**

Diurnal Cycle Precipitation over CONUS (JJA)

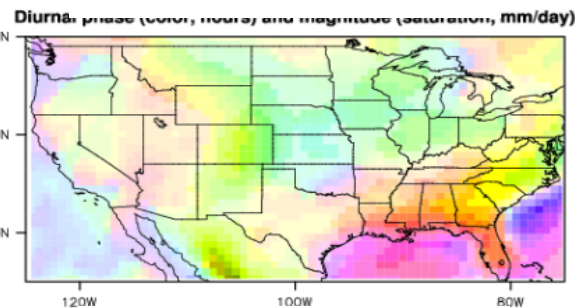

TRMM

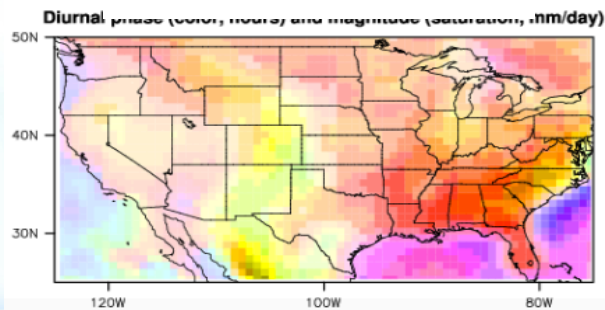

CNTL

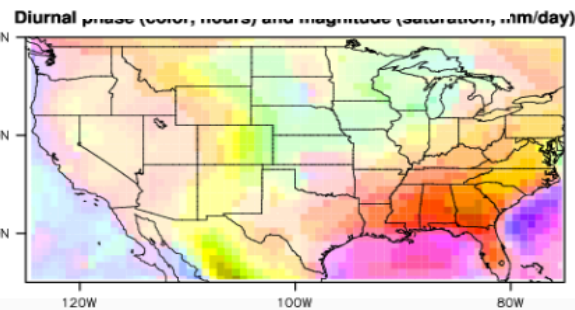

dCAPE&ULL

dCAPE

ULL

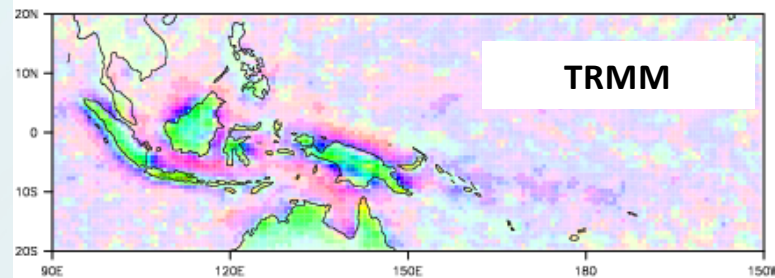

- EAMv1 peaks too early and fails to capture the nocturnal peak over the Great Plains
- The phase of diurnal cycle improved significantly with the new trigger
- The improvement is primarily due to ULL which helps to capture the nocturnal precip

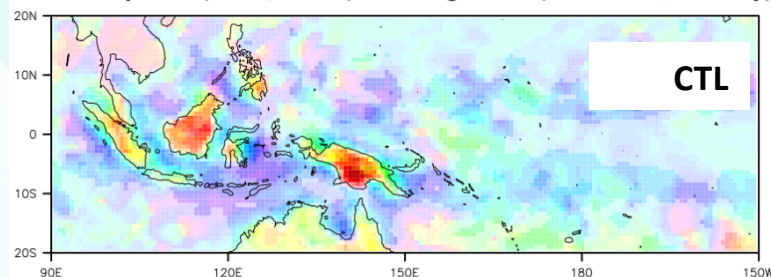

Diurnal cycle of Precipitation over the Maritime Continent (DJF)

Eastward propagation

Eastward propagation

Diurnal cycle over selected regimes

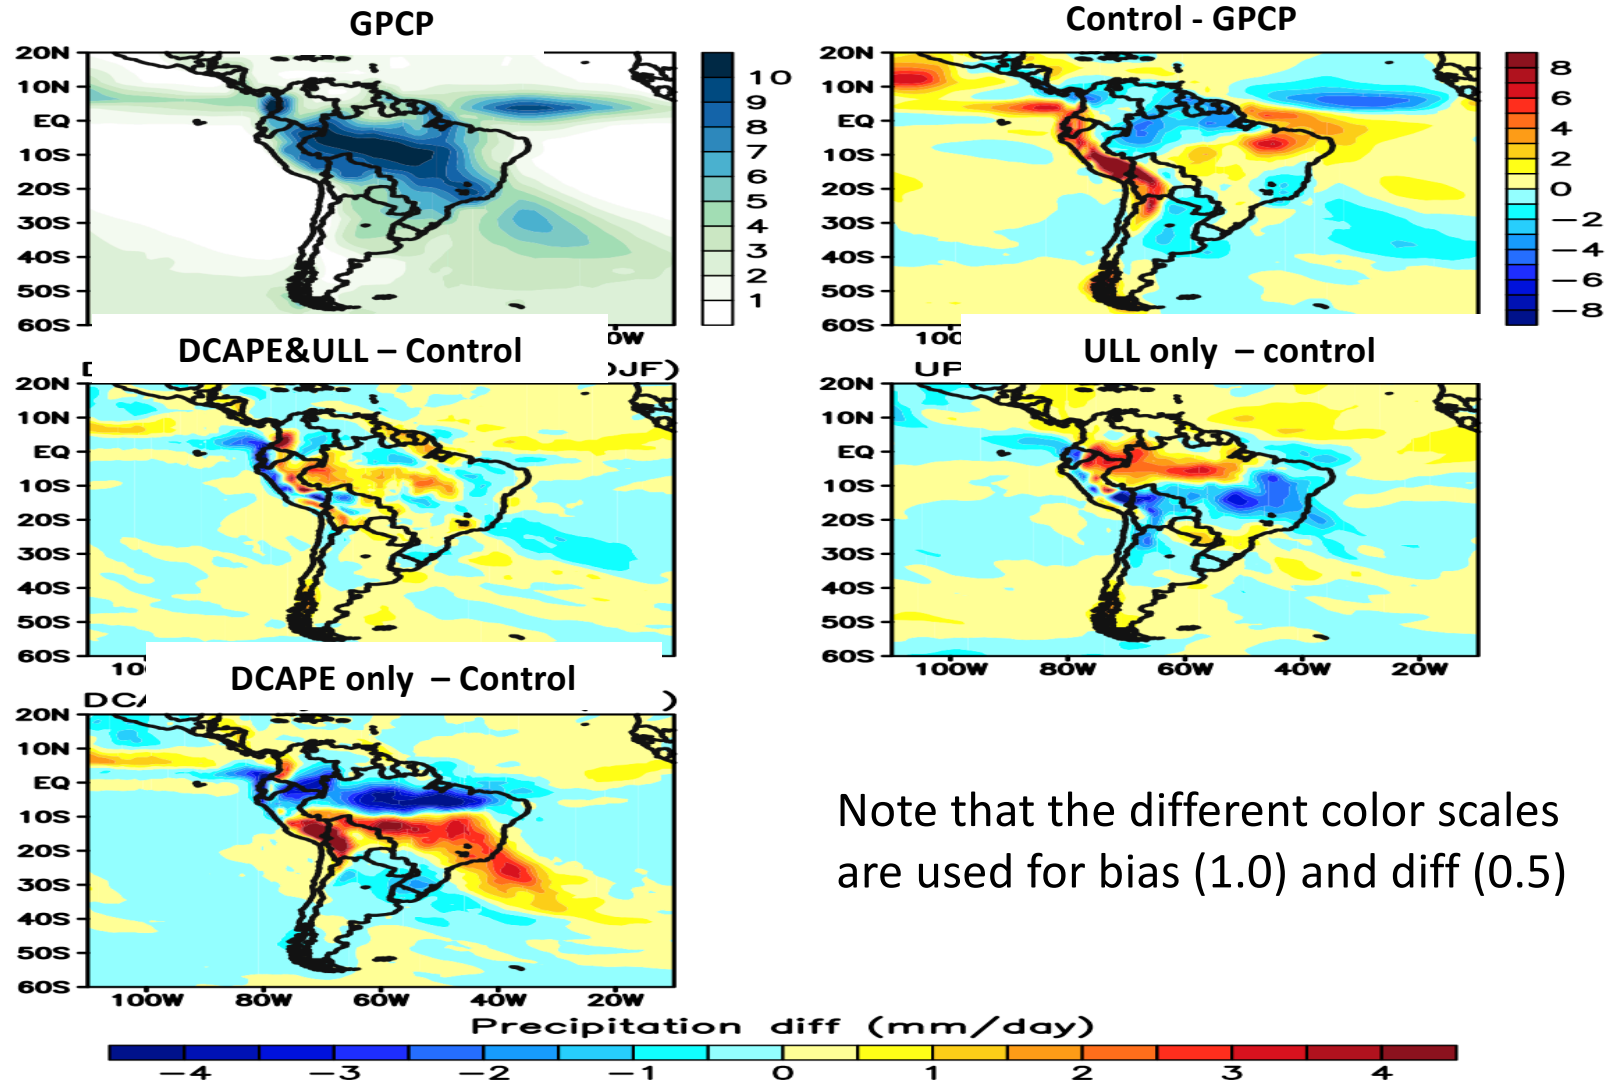

Summary

- A new convective trigger (DCAPE+ULL) was tested with EAMv1.
 - dCAPE used to prevent CAPE being released spontaneously
 - ULL used to remove the restriction of having the air parcel launch level within PBL for elevated nocturnal convection
- The new trigger has minor impact on the mean state, but it leads to a substantial improvement in the phase of the diurnal cycle of precipitation although its amplitude is still too weak
- dCAPE suppresses daytime convection while the unrestricted launch level is key to capturing nocturnal elevated convection
- EAMv1 starts to show the eastward propagation of MCSs, but processes behind it needs to be better understood.
- Only minor changes seen in tropical waves
